The MVS series snap-acting switch range is a safety switch with “*positive opening contacts*” according to the standards VDE 0660, IEC/EN60947 and UL508. Snap-action switches are spring activated switches which allow for extremely fast switching that is virtually independent of the speed of actuation. This product was designed for industrial applications that require high system and component reliability – featuring a mechanical life in excess of 10 million cycles!

Moujen’s MVS series is made with a blue transparent case material for easy contact evaluation -at any time- and has a protection degree of IP40.

This product has usage where it may be necessary to assure that the normally closed (NC) contacts will open and disengage the signal when the actuator is pressed. The actuator mechanism will break the circuit regardless of spring failure or contact welding due to a short-circuit. Applications may include process automation, robotics, medical, machine door and system control, etc.

There are seven different types of stainless steel actuators available, with or without roller mechanisms. Also, the switch comes with screw, solder and #250 fast-on terminals. It is the durable, reliable, “switch of choice” for OEM applications!
